In mathematics, when the elements of some set S have a notion of equivalence (formalized as an equivalence

relation) defined on them, then one may naturally split the set S into equivalence classes. These equivalence classes are constructed so that elements a and b belong to the same equivalence class if and only if they are equivalent.

Division by zero Wikipedia

In mathematics, division by zero is division where the divisor (denominator) is zero. Such a division can be formally expressed as $a / 0$ where a is the dividend (numerator). In ordinary arithmetic, the expression has no meaning, as there is no number which, when multiplied by 0, gives a (assuming $a \neq 0$), and so division by zero is undefined.

One can see mathematics through the lens of the search for truth and meaning in the world in this book. It explains how the Greeks sought to understand nature through mathematics and how later developments in math led to people's dominance over nature. It also contains Francis Bacon's warning that one must obey nature to make use of it.

Creative mathematicians seldom write for outsiders, but when they do, they usually do it well. Jerry King is no exception.
